

EVERIO Media Browser

1. Upload the EVERIO Media Browser by installing the JVC EVERIO disc that came with the video camera.
2. When this is installed on your computer connect your camera via the USB cable.
3. Turn the camera power switch on
4. Go to the Menu setting in your JVC camera and from the dropdown menu, at the top of LCD screen in your camera, scroll to the end of the menu and select 'Back up'. This allows you to upload your video files from the camera to your PC.
5. Select import video in the EVERIO Browser.
6. From the EVERIO browser you have four very clearly laid out options: Backup, Create Disc, Export and YouTube
7. Select Backup
8. All video files you have imported will appear in the video library.

How to convert .MOD files shot by JVC, Panasonic and Canon camcorders:

9. Movie Maker does not recognise the MOD files from the above cameras; therefore these files need to be converted to FLV files.
10. To do this, select the Movie Conversion option on your software.
11. Then Drag and Drop the files to the 'Drag Files Here' area and select 'Next' and 'Finish' to convert them.
12. Open Movie Maker and select 'Import' and you files should be visible.
13. You can now edit your video in Movie Maker.

If you do not have file conversions software see instructions below for downloading free converter from the internet:

The following information is taken from Pavtube.com

Step 1: Download, install and run Pavtube MOD Converter

1. Log on to <http://www.pavtube.com/mod-converter/>
2. Download and install either the free trial version of the MOD converter or the full version, which you will have to purchase.

Step 2: Import video files, select output and specify store path

1. Click 'Add' button to load your recorded MOD files to this program and select whatever formats you need from the 'Format' drop down list.
2. If you want to play the video on your mobile phone, you can select 3GP; to play on an iPod or iPhone, you need to select MP4; to share online, select FLV.
3. Select output folder to specify where to locate the output file i.e. the converted file or a default path will be given as an option.
4. You can also choose 'Merge into one file' where you have several files that you want to join to create a single file.

Figure 1 http://www.pavtube.com/guide/mod-to-flv_clip_image001.jpg

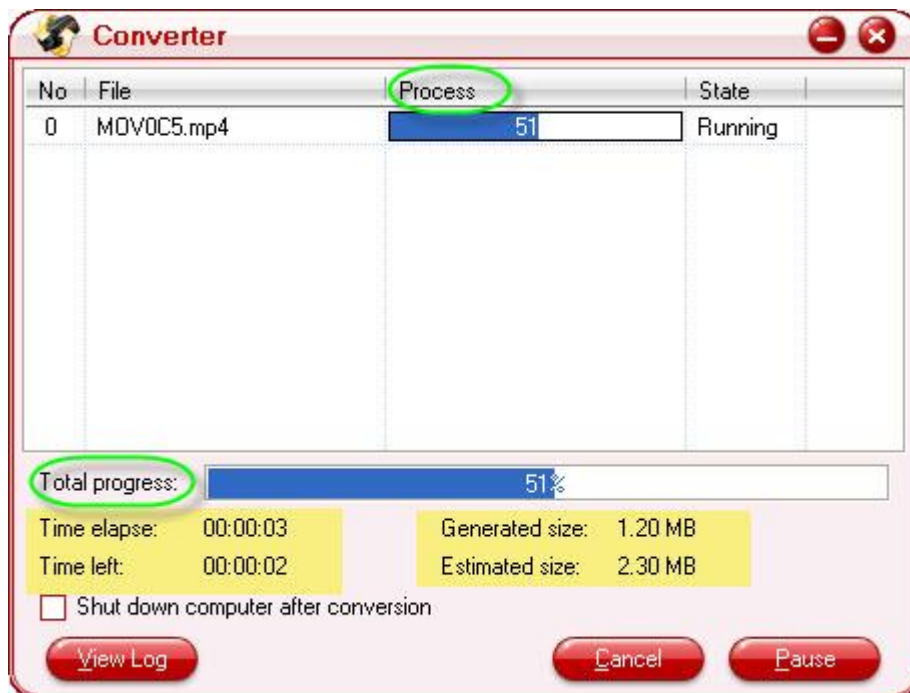

Step 3: Set advanced settings

Under the advanced settings you can set parameters for:

- output video
- bigger value
- better quality
- larger size

Step 4: Convert

Pavtube <http://www.pavtube.com/mod-converter/> (MOD Converter) provides you with a user friendly interface for converting and all conversion information can be found out in the following window. Information such as: total progress, time elapsed, time left, generated file size and file size.

<http://www.pavmac.com/pic/091204modconverter/modconverter-conversion091204.jpg>

Tips:

1. The converting speed of this software is 1-2 times faster than other similar converters. Batch conversions (more than one video file) can be done in a few minutes.
2. It does not have audio and video out-of-sync issues
3. With exception of adding text as watermark, images, GIF animations and videos can also be added as watermarks to realize the picture-to-picture effect.
4. The 'Trim' function can be used to select certain video clips to convert.
5. The 'Crop' function can be used to remove black edges or change the screen size.
